

Automation that survives Monday morning.

ONE WORKFLOW / CLEAR CONTROL / OPERABLE HANDOFF

One workflow. Clear failure behavior. A handoff your team can own.

Pragmatic Loop builds reliability-first AI workflows, API integrations, and internal tools for agencies and growing teams. We start with the operational bottleneck, make control points visible, and leave test evidence plus operating notes behind.

FOUR BOUNDED STARTING POINTS

01

Automation Rescue

Diagnose and harden an existing n8n, Make, Zapier, Python, or API workflow.

02

AI Workflow Pilot

Automate one bounded intake, document, triage, or reporting path with human approval.

03

API & Internal Tools

Build focused FastAPI services, webhooks, data flows, and operator-facing utilities.

04

Data & Monitoring

Collect authorized sources, validate freshness and completeness, and expose failures.

BEST FIT

An active workflow brief, an accountable reviewer, authorized data, sandbox or test access, sanitized fixtures, and a team that values reliable handoff over hidden automation.

INSPECTABLE REFERENCE EVIDENCE / NOT CLIENT WORK

Loopwatch

5 TESTS

Run history, bounded retries, explicit failures, human review.

Document Gate

7 TESTS

Controlled AI extraction, policy checks, duplicate blocking.

Signal Brief

8 TESTS

Source contracts, freshness states, claim withholding.

n8n Reliability Lab

7 INVARIANTS

Credential-free execution, retry planning, zero external actions.

n8n API Handoff Lab

10 INVARIANTS

Loopback HTTP, bounded 503 replay, zero outside actions.

DELIVERY LOOP

01

Map

Owners, data, exceptions, writes

02

Bound

Outcome, evidence, control, exclusions

03

Build

Validation, retries, logs, tests

04

Handoff

Artifacts, recovery, operator notes

OPERATING BOUNDARIES

- People approve consequential and ambiguous decisions.
- Initial review needs no production credentials or sensitive records.
- Portfolio evidence is never presented as client delivery.
- Price, schedule, scope, support, contract, and payment are confirmed after discovery.

Start with the workflow that fails, repeats, or steals time.
